1 FUNCTION: THE GLYCINE CLEAVAGE SYSTEM CATALYSES THE DEGRADATION OF GLYCINE. THE P PROTEIN BINDS THE ALPHA-AMINO GROUP OF GLYCINE THE REMAINING METHILAMINE MOIETY IS THE THEN TRANSFERRED TO THE LIPOAMIDE COFACTOR OF THE H PROTEIN.

1 CATALYTIC ACTIVITY: GLYCINE + LIPOYLPROTEIN - S-AMINOMETHYL-

1 LIPOAMIDE COFACTOR OF THE H PROTEIN.

1 COFACTOR: PYRIDOXAL PHOSPHATE.

1 COFACTOR: PYRIDOXAL PHOSPHATE.

1 SUBUNIT: THE GLYCINE CLEAVAGE SYSTEM IS COMPOSED OF FOUR PROTEINS:

2 INDUCTION: BY GLYCINE.

2 INDUCTION: BY GLYCINE CLEAVAGE SYSTEM P-PROTEIN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This SWISS-PROT entry is copyright. COFACTOR: PYRIDOXAL PHOSPHATE.
SUBUNIT: HOMODIMEN. THE GIVETINE CLEAVAGE SYSTEM IS COMPOSED OF FOUR PYRIDINS: P, T, L, AND H.
SUBCELLULAR LOCATION: MITOCHONDRIAL.
DISEASE: DEFECTS IN GCSP ARE THE CAUSE OF TYPE I NONKETOTIC HYPERGLYCLINEMIA (NKH1). NKH IS AN ANTOSOMAL RECESSIVE DISEASE CHARACTERIZED BY ACCUMULATION OF A LARGE AMOUNT OF GLYCINE IN BODY FLUID AND BY SEVERE NEUROLOGICAL SYMPTOMES.
SIMILARITY: TO OTHER GLYCINE CLEAVAGE SYSTEM P-PROTEIN.
                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            GLYCINE. THE P PROTEIN BINDS THE ALPHA-AMINO GROUP OF GLYCINE THROUGH ITS PYRIDOXAL PHOSPHATE COFACTOR; CO(2) IS RELEASED AND THE REMAINING METHYLAMINE MOIETY IS THE THEN TRANSFERRED TO THE LIPOAMIDE COFACTOR OF THE H PROTEIN.

CATALYTIC ACTIVITY: GLYCINE + LIPOYLPROTEIN - S-AMINOMETHYL-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Kume A., Koyata H., Sakakibara T., Ishiguro Y., Kure S., Hiraga K.; "The glycine cleavage system. Molecular cloning of the chicken and human glycine decarboxylase cDNAs and some characteristics involved in the deduced protein structures."; J. Biol. Chem. 266:3323-3329(1991).

Submitted (SEP-1995) to the SWISS-PROT data bank.
-!- FUNCTION: DEAMINATES L-THREONINE, BUT ALSO L-SERINE TO A LESSER
EXTENT (BY SIMILARITY).
-!- CATALYTIC ACTIVITY: L-THREONINE + H(2)0 = 2-OXOBUTANOATE + NH(3)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               -!- COFACTOR: PYRIDOXAL PHOSPHATE (BY SIMILARITY).
-!- ENZYME REGULATION: ISOLEUCINE ALLOSTERICALLY INHIBITS WHILE VALINE ALLOSTERICALLY ACTIVATES THIS ENZYME (BY SIMILARITY).
-!- PATHWAY: FIRST STEP OF ISOLEUCINE BIOSYNTHESIS.
-!- SUBUNIT: HOMOTETRAMER (BY SIMILARITY).
-!- SIMILARITY: TO THREONINE DEHYDRATASE CATABOLIC AND SERINE DEHYDRATASE.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            --- FUNCTION: THE GLYCINE CLEAVAGE SYSTEM CATALYSES THE DEGRADATION OF GLYCINE GLYCINE. THE PROTEIN BINDS THE ALPHA-AMINO GROUP OF GLYCINE THROUGH ITS PYRIDOXAL PHOSPHATE COFACTOR; CO(2) IS RELEASED AND THE REMAINING METHYLAMINE MOIETY IS THE THEN TRANSFERRED TO THE LIPOAMIDE COFACTOR OF THE H PROTEIN (BY SIMILARITY).

--- CATALYTIC ACTIVITY: GLYCINE + LIPOYLPROTEIN = S-AMINOMETHYL-DIHYDROLIPOYLPROTEIN + CO(2).

--- COFACTOR: PYRIDOXAL PHOSPHATE (BY SIMILARITY).

--- SUBUNIT: THE GLYCINE CLEAVAGE SYSTEM IS COMPOSED OF FOUR PROTEINS:
P, T, L, AND H (BY SIMILARITY).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   MEDLINE: 98295987.

The GDCSP gene encoding P-protein of the glycine cleavage system in the C3-C4 intermediate plant Flaveria anomala.";

(In) Plant Gene Register PGR98-004.

-!- FUNCTION: THE GLYCINE CLEAVAGE SYSTEM CATALYSES THE DEGRADATION OF GLYCINE. THE PROTEIN BINDS THE ALPHA-AMINO GROUP OF GLYCINE THROUGH ITS PRIDOXAL PHOSPHATE COFACTOR; CO(2) IS RELEASED AND THE REMAINING METHYLAMINE MOIETY IS THE THEN TRANSFERRED TO THE LIPOAMIDE COFACTOR OF THE H PROTEIN.

-!- CATALYTIC ACTIVITY: GLYCINE + LIPOYLPROTEIN - S-AMINOMETHYL-DIHYDROLIPOYLPROTEIN + CO(2).
                                                                                                                                                                                                                                                                                                                                                                                                      -!- COFACTOR: PYRIDOXAL PHOSPHATE.
-!- SUBUNIT: HOMODIMER (BY SIMILARITY). THE GLYCINE CLEAVAGE SYSTEM IS COMPOSED OF FOUR PROTEINS: P, T, L, AND H.
-!- SUBCELLULAR LOCATION: MITOCHONDRIAL.
-!- SIMILARITY: TO OTHER GLYCINE CLEAVAGE SYSTEM P-PROTEIN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        COSSU R., Bauwe H.;

"Two genes of the GDCSP gene family from the C4 plant Flaveria
"Two genes of the GDCSP gene family from the C4 plant Flaveria
"Two genes of the GDCSPA encoding P-protein and GDCSPB, a pseudogene.";

(In) Plant Gene Register PCRSB-002.

-!- FUNCTION: THE GLYCINE CLEAVAGE SYSTEM CATALYSES THE DEGRADATION OF GLYCINE
THROUGH ITS PYRIDOXAL PHOSPHATE COFACTOR: CO(2) IS RELEASED AND
THE REMAINING METHYLAMIE MOIETY IS THE THEN TRANSFERRED TO THE
LIPOAMIDE COPACTOR OF THE H PROTEIN.

-!- CATALYTIC ACTIVITY: GLYCINE + LIPOYLPROTEIN = S-AMINOMETHYL-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               MITOCHONDRION (POTENTIAL).

DIHYDROLIPOYLPROTEIN + CO(2).
-!- COFACTOR: PYRIDOXAL PHOSPHATE.
-! SUBUNIT: HOWDIMER (BY SIMILITY). THE GLYCINE CLEAVAGE SYSTEM IS COMPOSED OF FOUR PROFIENS: P, T, L, AND H.
-!- SUBCELLULAR LOCATION: MITOCHONDRIAL.
-! SIMILARITY: TO OTHER GLYCINE CLEAVAGE SYSTEM P-PROTEIN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Solanum tuberosum (Potato).

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

immunogenic T-cell peptide epitopes present in polypeptide antigens. The method involves the identification of peptide sequences capable of binding to an HLA (human leukocyte antigen) class I molecule and measuring the binding of this epitope peptide to the HLA class I peptide. The stability of binding of the peptide and MHC (major histocompatability complex) class I molecule is measured on intact human B cells carrying the MHC molecule at their cell surfaces. The method can be used to select peptide epitopes for generating vaccines against a disease associated with the polypeptide e.g. cancers or AIDS. The peptide epitopes are especially T-cell peptide epitopes with strong anti-tumour and anti-viral limmune responses. Peptide W39723 is derived from the human carcino-embryonic antigen (CEA) and has the ability to bind to the human MHC class I allele HLA-A2.1.
                                                                                                                   Peptides W39430-W39734 are used in a novel method for the selection of immunogenic T-cell peptide epitopes present in polypeptide antigens. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The peptide epitope W77119-W77138 were created for human tumour-specific cytotoxic T lymphocyte response. These peptides are are cysteinedepleted mutants of a native disease-specific CTL epitope. The cysteinedepleted CTL epitopes elicit a stronger or more specific CTL response than the native epitope. The epitopes can be used in a disease-specific than the native epitope. The epitopes can be used in a disease-specific immunogen to protect a mammal against disease in particular melanomas. The peptides may also be used to screen a sample for the presence of an antigen with the same epitope, or with a different cross-reactive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

Sequences shown in W70044 to W70052 represent peptides derived from carcinoembryonic antigen (CEA). The peptides can bind to a human leukocyte antigen (HLA), HLA-A2.1 and are used to exemplify the method of leukocyte antigen (HLA), HLA-A2.1 and are used to exemplify the method of invention of producing antigen-specific cytotoxic T cells (CILS) in viro. The method comprises contacting immunogenic peptides from an olecules with antigen presenting cells (APCS) pretreated with no presence of at least 2 incubating the APCS with purified CDB cells in the presence of at least 2 incubation growth factors, thereby producing antigen-specific CTLS. A method for specifically killing target cells in a human patient is also provided which comprises obtaining a fluid sample containing CTLS from a patient, contacting the cytotoxic T cells with APCS pretreated with pre-treatment growth factors, where the APCs comprise class I MHC molecules. The pretreated APCs are incubated with the cytotoxic growth factors, thereby producing activated CTLS which are contacted with a carrier to form a composition can then be administered to the patient. The activated CTLS can be used for treating cancers, immune disorders, viral infections, contactions, contactions, contactions.

The immunogenic peptides can bind to a specific HLA allele (i.e. HLA-A subtypes HLA-A2.1, Al, A3.2 or A24.1 or HLA-B or C) and induce a cytotoxic T cespoose against the antigen from which the peptide is derived. Crownally induced by an antigen from which the peptide fragment bound or normally induced by an antigen from of a peptide fragment bound are particularly important in the form of a peptide fragment bound are particularly important in tumour rejection and in fighting viral infections. The peptides are therefore useful therapeutically to treat or prevent viral infections and cancers in mammals (especially humans) crossate cancer, hepatitis B and C, AIDS, and renal carcinoma. They can be administered as vaccines to elicit an immune response in they can be administered as vaccines to elicit an immune response in conversion and infection or the control or cont

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New immunogenic peptides with HLA binding motif, useful in treatment and diagnosis of cancers and viral diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         cancer, or used to treat chronic or acute conditions. They are also useful diagnostically, and can be used to induce a cytotoxic T cell with the peptide e.g. to produce CTLs ax vivo for infusion back into a patient. The polynucleotides encoding the immunogenic peptides are also useful therapeutically and for immunisation as above.
                                                                                           ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      its epitopes, particularly for treating gastrointestinal, breast, pancreatic, bladder, ovarian, lung or prostatic carcinoma. They can also be used to proliferate T cells, e.g. from vaccinated subjects, for use in adoptive transfer therapy. (ID) are used to inhibit CEA-specific immune responses, e.g. in vaccinated subjects, to prevent an autoimmune reaction to cancer immunotherapy (i.e. to prevent attack on normal but CEA-expressing cells). (Ia) are more active than native sequence (I) and generate a highly specific and systemic anti-CEA response. Cytotoxic T cells generated recognize bork (ia) and native CEA epitopes. The present sequence represents a specifically claimed example of (Ia).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes peptides (A) that comprise agonists (Ia) or antagonists (Ib) of human carcinoembryonal antigen (CEA). (Ia) are used in vaccines to kill or inhibit carcinoma cells that express CEA or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  A Y45390 to Y48214 represent specifically claimed immunogenic peptides having a human major histocompatibility complex (MHC) Class I (also known as human leukocyte antigen (HLA) binding motif. The immunogenic response against the artigen (HLA) binding motif. The immunogenic peptides can bind to a specific HLA allele (i.e. HLA-A subtypes C PED to a period is derived.

Tesponse against the artigen from which the peptide is derived.

Cytoctoxic T lymphocytes (CTLS) which destroy antigen bearing cells are normally induced by an antigen in the form of a peptide fragment bound in a HLA molecule, rather than the intext foreign antigen itself, and are particularly important in tumour rejection and in flighting viral infections. The peptides are therefore useful therapeutically to treat or prevent viral infections and cancers in mammals (especially humans) infections. The peptides are therefore useful therapeutically one cancer, heartis B and C, alloit an immune response in Individuals susceptible or otherwise at risk of viral infection or cancer, or used to treat chronic or acute conditions. They are also useful diagnostically, and can be used to induce a cytocoxic T cell with the peptide e.g. to produce CTLs ex vivo for infusion back into a patient. The polynucleotides encoding the immunogenic peptides are also useful
                                                                                                                                                              Immunogenic peptide having a human leukocyte antigen binding motif #1166.
                                                                                                                                                                                                     Human leukocyte antigen; binding; immunogenic; glycoprotein; MHC; HLA; immune response; T cell activation; major histocompatibility complex; cytotoxic T lymphocyte; CTL; tumour rejection; viral infection; cancer; prostate cancer; hepatitis B; hepatitis C; AIDS; renal carcinoma; vaccine; immunisation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New immunogenic peptides with HLA binding motif, useful in treatment and diagnosis of cancers and viral diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Southwood

The invention relates to a method for the production of non-immunogenic proteins. The method comprises determining at least part of the amino acid sequence of the protein; (b) identifying in the amino acid sequence one or more potential epitopes for T-cells (T-cell epitopes) of the given species; and (c) modifying the amino acid sequence to eliminate at least one of the T-cell epitopes identified in step (b) thereby to eliminate or reduce the immunogenicity of the protein when exposed to the immune system of the given species. A method of analysing a pre-existing protein to predict the basis for immunogenic responses is also provided. The methods can be used particularly for reducing the immunogenicity of products can be used for diagnosis and therapy. The present sequence represents the protein sequence of vaccine 2 708 VI.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

The sequences given in R77435-38 are chimaeric proteins comprising portions of human biliary glycoprotein (BGP) and the human membrane-bound carcinoembryonic antigen (CEA). These chimaeric proteins were used to identify the PRIA3 epitope. The PRIA3 epitope was found to be an epitope of CEA within the B3-GPI region. Chimaeras in which the CEA is no longer membrane bound did not react with anti-PRIA3 antibodies indicating that the PRIA3 epitope is not present in non-membrane bound hybrid proteins. Antibodies which recognise the PRIA3 epitope are used in the detection of well and poorly differentiated colorectal carcinomas. The isolation of the specific PRIA3 epitope allows the development of monoclonal antibodies specific for colorectal carcinoma. They can be used in the study, isolation and purification of molecules to which they specifically bind and the imaging and treatment of cells exhibiting the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Primer; amplify; polymerse chain reaction; PCR; human; billary glycoprotein; BGP; membrane-bound; carcinoembryonic antigen; CEA; chimaeric protein; PRIA3 epitope; anti-PRIA3 antibody; colorectal carcinoma; monoclonal antibody.
                                                                                                                                                                           New molecules which bind carcinoembryonic antigen - used for the diagnosis and treatment of colorectal carcinoma and for isolation

                                                                                                                                                                                      The sequences given in R77435-38 are chimaeric proteins comprising portions of human biliary glycoprotein (BGP) and the human membrane-bound carcinoembryonic antigen (CEA). These chimaeric proteins were used to identify the PRIA3 epitope. The PRIA3 epitope was found to be an epitope of CEA within the B3-GPI region. Chimaeras in which the CEA is no longer membrane bound did not react with anti-PRIA3 antibodies in the constraint of membrane bound hybrid proteins. Antibodies which recognise the PRIA3 epitope are used in the detection of well and poorly differentiated colorectal carcinomas. The isolation of the specific PRIA3 epitope allows the development of monoclonal antibodies specific for colorectal carcinoma. They can be used in the study, isolation and purification of molecules to which they expecifically bind and the imaging and treatment of cells exhibiting the

portions of human biliary giveoprotein (BGP) and the human membrane-bound carcinoembryonic antigen (CEA). These chimaeric proteins were used to identify the PRIA3 epitope. The PRIA3 epitope was found to be an epitope of CEA within the B3-GPI region. Chimaeras in which the CEA is no longer membrane bound did not react with anti-PRIA3 antibodies in no longer membrane bound did not react with anti-PRIA3 antibodies in not present in non-membrane bound hybrid proteins. Antibodies which recognise the PRIA3 epitope are used in the detection of well and poorly differentiated colorectal carcinomas. The isolation of the specific PRIA3 epitope allows the development of monoclonal antibodies specific for colorectal carcinoma. They used in the study, isolation and purification of molecules to which they pecifically bind and the imaging and treatment of cells exhibiting the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Primer; amplify; polymerse chain reaction; PCR; human; billary glycoprotein; BGP; membrane-bound; carcinoembryonic antigen; CEA; chimaeric protein; PR1A3 epitope; anti-PR1A3 antibody; colorectal carcinoma; monoclonal antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The sequences given in R77435-38 are chimaeric proteins comprising
                                                                                                                                                                                                                                                                                                     New molecules which bind carcinoembryonic antigen – used for the diagnosis and treatment of colorectal carcinoma and for isolation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ;

R60619. CEA is free from cross-reactive CEA-like antigens, it is antigenically indistinguishable from the solution form of CEA shed from tumour cells, and it is devoid of ethanolamine R60619 can be used in a reagent composition for detecting neoplastic diseases in biological samples, or in an immunoassay process where it can specifically detect the presence of tumour cells in a biological sample e.g. blood.

                                                                                                                                                                                                                                                             The sequences given in R77435-38 are chimaeric proteins comprising portions of human biliary glycoprotein (BGP) and the human membrane-bound carcinoembryonic antigen (CEA). These chimaeric proteins were used to identify the PRIA3 epitope. The PRIA3 epitope was found to be an epitope of CEA within the B3-GPI region. Chimaeras in which the CEA is no longer membrane bound did not react with anti-PRIA3 antibodies indicating that the PRIA3 epitope is not present in non-membrane bound hybrid proteins. Antibodies which recognise the PRIA3 epitope are used in the detection of well and poorly differentiated colorectal carcinomas. The isolation of the specific PRIA3 epitope allows the development of monoclonal antibodies specific for colorectal carcinoma. They can be used in the study, isolation and purification of molecules to which they specifically bind and the imaging and treatment of cells exhibiting the

rCEA into the insect cell glycosylation pathway. rCEA can be produced at high levels in Sf900+ insect cells grown in serum-free media, and isolated to a purity of over 95%. It is used as an immunogen in humans to protect against cancer, partic. breast, lung or colon cancer.
                                                                                                                                     ;

MOTI M., Sagakami Y., Narita M., Isogai A., Fujino M., Kitada C.,
Craig R.A., Clewell D.B., Suzuki A.;

Isolation and structure of the bacterial sex pheromone, CADI, that
induces plasmid transfer in Streptococcus faecalis.";

FEBS Lett. 178:97-100(1984).

-i- FUNCTION: CADI IS INVOLVED IN THE CONJUGATIVE TRANSFER OF THE
HEMOLYSIN PLASMID PADI.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Enterococcus faecalis (Streptococcus faecalis).
